TITLE: Quaternary Volcanos of Northern Kamchatka (Chetver-
tichnyye vulkany Severnoy Kamchatki)

PERIODICAL: Tr. labor. vulkanol. AN SSSR, 1956, Nr 12, pp 191-196

ABSTRACT: The line of volcanos in Centralnyy Range extends in
the northeast to the isthmus of the Kamchatka Pe-
ninsula and follows farther on for a considerable
distance along the southeast slopes of the Koryakskiy
Range. The volcanos form complex groups of hills
with a relative height of 300 m to 400 m. A detailed
study was made of the extreme northeast volcano of
Obruchev, located on the divide of the Ol'khovaya and
Gatatygrynnyn Rivers. Today this volcano forms a
group of conical hills. Its relative height is 1 km

Card 1/4

15-57-4-4406

Quaternary Volcanos of Northern Kamchatka (Cont.)

to 1.5 km. Its eroded crater is a depression about 1 km in diameter. At the southwestern end of the probable fracture lies the Krasnyy Otkos volcano. In the space between these two there are no less than three volcanos. Large masses of opaline rocks and quartzites are characteristic for the North Kamchatka volcanos. These were formed by the action of fumaroles and by the hydrothermal processes. Three stages of alteration have been established for the Obruchev volcano. The chemical composition of the andesite lavas of the volcano at the different stages are indicated in the table. There is no present fumarole activity near the volcanos of North Kamchatka. Centralnyy Range and some zones of Koryakskiy Range were an area of intensive volcanic activity during the entire Neogene, and a large part of the extrusive formations comprising the range are, very likely, not Quaternary but Tertiary.

TITLE: Reduction of the weight of small assembled reinforced concrete bridges. (Snizheniye vesa malykh sbornykh zhelezobetonnykh Mostov).

PERIODICAL: "Beton i Zhelezobeton" (Concrete and Reinforced Concrete), 1957, No.2, pp.58-59 (U.S.S.R.)

ABSTRACT: The "pile"-tressle bridges of Ingenieur N.M. Kolokolov's can be mass-produced efficiently and assembled. The speed of erection constitutes the main advantage of this method. A railway bridge (49 m long) was erected in 6 days. A highly organised and specialised party can complete a 30 m run of this bridge in one day. The Lentransmostprojekt developed a transportable bridge section of a width of 5 m, designed by E. A. Artamonov. However, these units are not very economical as the concrete consumption is 37% higher than in N.M. Kolokolov's design and by 59% higher than by a method developed by the Novosibirsk Institute of Rail Transport (NIIZHT). The weight of the units (23.5 tons) create difficulties in hoisting, even with 45 ton capacity railway cranes. The Kolokolov unit weighs only 9 tons. The Institute NIIZHT (Bridge Building Laboratory) has designed a single unit bridge section with attachable cantilever ends. This 5 m wide unit weighs 15.4 tons and can be

Reduction in the weight of small assembled reinforced concrete bridges. (Cont.)¹⁸⁵

handled easily with a 50 ton crane. An analysis has shown that the volume of concrete and reinforced concrete of bridges up to 20 m span constitutes 70% of the whole weight. There is one drawing and one table.

TITLE: Zoning in the Transformed Rocks of the Kamchatka Central Range
(Zonal'nost' izmenennykh porod sredinnoego Kamchatskogo khreba)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 4, pp 678-682 (USSR)

ABSTRACT: The zoning in the Kamchatka Central Range has been studied by the All-Union Scientific Geological Research Institute since 1957. The Kamchatka mountain chain represents an anticlinorium composed of magmatic and metamorphic rocks varying in age from Cambrian to Quaternary. A deep-seated fault zone runs approximately along the axis of the anticlinorium. This zone influenced the implacement of most of the young magmatic rocks in the structure of the anticline as well as controlling the gas-hydrothermal processes and the ore formation. The zones of altered rocks and the ore occur in feather-faults associated with the main shear zone. In the same associated faults occur small diorite intrusions, stocks of acidic andesite and dike suites of diorite porphyry and other rocks. The anticlinorium has been mildly folded perpendicular to its axes. Therefore, the

Card 1/4

SOV/20-122-4-39/57

Zoning in the Transformed Rocks of the Kamchatka Central Range

plunge of one single segment of the axis allows observation of different structural levels. This peculiarity is intensified by the fact that the principal ore deposition took place in the late Neogene, i.e., the time of maximum leveling of relief in this area. In the early Quaternary the present relief was formed by differential block uplift. Through the erosion that followed, the different levels of Late Neogene vulcanism and ore deposition were exposed. At over 50 profiles of altered rock the authors have shown that along the linear shear zone the association of new minerals, i.e., facies, in the altered rocks is characteristic in a regular manner. Furthermore, near the fault zone which produced channels for the hydrothermal solutions there is a clear horizontal and vertical zoning of these facies (Fig 1). In the middle structural blocks, composed of folded Paleogene and Neogene volcanic masses of andesite and basalt, the following characteristic zones are found: 1) mono-quartz, lower zone, 2) kaolinite (dickite), lower zone, 3) quartz-sericite or muscovite, lower zone, 4) propylite, consisting of chlorite, calcite, albite and zeolites. These zones correspond to zoning in the altered rock of secondary quartzites, and it is

Card 2/4

SOV/20-122-4-39/57

Zoning in the Transformed Rocks of the Middle Kamchatka Mountain Ridge

here hypothesised that they represent a diffusion-metasomatism resulting from the gradual neutralization of acid solutions as they react with the surrounding rock (Refs 2,3). The observations prove the next step in the evolution of the ore solutions: the alkalic post-magmatic solutions ascended in the fracture zone carrying large amounts of silica and ore elements. The raising of the oxidation potential, the gradual lowering of temperature and pressure decreased the solubility of the silicon. Through this process the following took place: a metasomatic silicification of the country rock with the formation of massive quartz-propylite, the rapid fall of temperature and pressure in a higher zone of more highly fractured rock with the consequent deposition of quartz in fractures and the building of quartz-stock works with metal ores of copper, lead, and zinc. In the highest beds near the earth's surface the rapid cooling of the remaining solution formed acids which bleached the country rock, creating the secondary quartzite. There are 1 figure and 3 references, 3 of which are Soviet.

the Peninsula

TITLE: The Structural-tectonic Regions of Kamchatka/(Strukturno-tektonicheskiye rayony Kamchatki)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 1, pp 156-158
(USSR)

ABSTRACT: In recent years, important details helping to define the geological structure of Kamchatka have been detected by the geologists of the Dal'nevostochnoye (Far East) and Pyatoye (Fifth) geologicheskoye upravleniye (Geological Administrations). This has become evident with the composition of the new geological survey map (1957) (Fig 1). Kamchatka is a young folding area, chiefly consisting of cenozoic and closely connected Cretaceous formations. A middle massif of metamorphic rocks and of such risen from the depth by eruption lies in the south of the Sredinnyy chain. Two directions become evident in the chief structures of the peninsula: (a) a southern one corresponding to the prolongation of the middle massif, and (b) a north-eastern one connected with the range of two parallel fold arcs. One of the arcs (Vostochnyy Kamchatskiy chain) is the outer,

Card 1/4

the

SOV/20-127-1-42/65

The Structural-tectonic Regions of Kamchatka Peninsula

and the other (the central and northern part of the Sredinnyy chain) is the inner and roughly follows the axis of the peninsula. The arcs are the most important structural-facial and -metallogenic zones. The outer arc consists of an anticlinal elevation from the Upper Cretaceous sediments and volcanic rocks, also ultrabasic ones among them. Pyrite-ore occurrences with copper, nickel, cobalt, occasionally with molybdenum are found here. Exclusively cenozoic volcanic rocks are developed in the inner range of the arc. There are ore occurrences of: mercury, antimony, gold, copper, and molybdenum, which have formed near the surface and rest in the midst of secondary quartzites and propylites. The arcs bend eastwards at the hitherto little investigated transversal south-eastern dislocation zone which crosses the peninsula near Petropavlovsk. The inner arc is continued as Bol'shaya Kuril'skaya insular chain (Great Kuriles), while the outer arc apparently follows a subaqueous projection eastwards, reaching the Malyye Kuril'skiye (Little Kuriles) islands. Both arcs are continued in the north-east as Koryakskoye nador'ye (Koryak mountains). The outer arc unites with the structures of Alaska. The Sredinnyy massif is prolonged northwards by young anticlinal folds. This

Card 2/4

the
The Structural-tectonic Regions of Kamchatka Peninsula

SOV/20-127-1-42/65

massif and both the mentioned arcs form the chief anticlinoria of Kamchatka and the orographically marked mountain chains. A 4th smaller anticlinorium consisting of Paleogene and Miocene volcanic rocks and of flysch stretches along the eastern peninsulas. Synclinoria lie between the anticlinoria: Western Kamchatskiy, Palanskiy, Parapol'skiy, and Penzhinskiy with Neogene coal- and petroleum bearing sediments. They represent a rear - downwarping (tylovoy progib) which is divided into two parts by the central elevation. The Tsentral'-naya Kamchatskaya depression forms an inner (vnutrennyaya) downwarping between the fold arcs. Oceanic marginal (peredovyye) depressions are near the east coast and south of the Aleutians. Along with the two young fold arcs there are fractures in depth, along which powerful tertiary and Upper Cretaceous volcanic masses are spread. Three quaternary volcanic zones lie all over the mentioned structural elements. There is 1 figure.

AUTHOR: Sergeyev, A. S., Docent

TITLE: Dissertations (Dissertatsii)

PERIODICAL: Elektrichestvo, 1958, Nr 4, pp. 90 - 91 (USSR)

ABSTRACT: For the Degree of a Candidate of Technical Sciences,
1946-1953.
At the All Union Scientific Research Institute for Railroad
Traffic Engineers(Vsesoyuznyy nauchno-issledovatel'skiy in-
stitut inzhenerov zheleznodorozhnogo transporta).
M. D. Treyvas, on March 22, 1946: " Selection of Filtering
Devices for Train Undercarriages With Non-Controlled and
Controlled Mercury-Arc Rectifiers". Official opponents were:
Doctor of Technical Sciences Professor G. V. Dobrovolskiy
and Engineer S. M. Serdinov.
A. V. Voronin, on June 21, 1946: " Current Distribution Between
the Longitudinal Lines of the Contact Network and the Cal-
culation of the Heat Development of the Network-Elements".
Official opponents were: Doctor of Technical Sciences K. M.
Markvardt and Doctor of Technical Sciences Professor D. M.
Minov.

Card 1/4

165-58-4-31/37

Dissertations

I. I. Vlasov, on February 21, 1947: "Some Problems on the Wear of Contact Lines for Electrified Railroads". Official opponents were: Doctor of Technical Sciences Professor K. G. Markvardt and Engineer S. M. Serdinov.

I. A. Korchagin, on June 27, 1947: "Start of the Production and the Investigation of Selenium Rectifiers for the Supply Devices of the Signalization-Centralization Blocking". Official opponents were: Doctor of Technical Sciences Professor M. I. Vakhnin and Candidate of Technical Sciences S. B. Yuditskiy.

A. V. Posse, on October 17, 1947: "Monophase D.C. Ignitron Transformer for Main-Line Electric Locomotives". Official opponents were: Doctor of Technical Sciences Professor G. I. Babat and Candidate of Technical Sciences M. A. Chernyshev.

R. I. Miroshnichenko, on June 30, 1950: "Development of the Method for the Calculation of Smoothing Devices for Rectifier Substations". Official opponents were: Doctor of Technical Sciences Professor M. I. Mikhaylov and Engineer S. M. Serdinov.

I. I. Rykov, on March 2, 1951: "Atmospheric Excess Voltages in Traction Equipment of D.C.-Railroads". Official opponents

Card 2/4

125-58-4-31/37

Dissertations

were: Doctor of Technical Sciences Professor V. V. Burgsdorf and Engineer V. I. Tromifov.
B. Ye. Geronimus, on May 25, 1951: "Selection and Maintenance of External Optimum Characteristics for Mercury-Arc Rectifier Train Substations of Mainline Railroads". Official opponents were: Doctor of Technical Sciences M. A. Chernyshev and Engineer L. M. Pertsovskiy.
V. D. Radchenko, on December 14, 1951: "Protection of D.C. Electro-Locomotives Against Atmospheric Excess Voltages". Official opponents were: Doctor of Technical Sciences M. A. Chernyshev and Candidate of Technical Sciences D. V. Razevig.
Ye. P. Ivanov, on December 28, 1951: "Determination of Excess Recuperation Energy in Electrified Railroads". Official opponents were: Doctor of Technical Sciences M. A. Chernyshev and Candidate of Technical Sciences M. Ye. Krest'yanov.
Yu. L. Kartvelishvili, on January 18, 1952: "Investigation of the Operation of Train Electromotors in Diesel Locomotives in an Operation With Weakened Field". Official opponents were: Doctor of Technical Sciences Professor Ye. V. Nitusov and Doctor of Technical Sciences A. S. Dimitradze.

Card 3/4

105-58-4-51/37

Dissertations

S. M. Domanitskiy, on March 13, 1953: " Excitation Automation in Train Generators in Diesel Locomotives When Using Magnetic Amplifiers". Official opponents were: Doctor of Technical Sciences Professor Ye. V. Nitusov and Candidate of Technical Sciences Docent A. D. Stepanov.

V. S. Khvostov, on December 25, 1953: " Magnetic Calculations and Construction of the Collector Potential Curves in D.C. Traction Motors". Official opponents were: Doctor of Technical Sciences N. V. Gorokhov and Candidate of Technical Sciences Docent P. N. Shlyakhto.

PHASE I BOOK EXPLOITATION

SOV/4825

Alekseyev, Vladimir Alekseyevich, and Ivan Ivanovich Vlasov

Sto priborov-avtomatov (One Hundred Automatic Devices) [Moscow] Izd-vo
"Moskovskiy rabochiy," 1960. 62 p. 2,500 copies printed.

Ed.: Ye. Chernov; Tech. Ed.: S. Pavlova.

PURPOSE: This booklet is intended for plant personnel concerned with the automation of industrial processes.

COVERAGE: The booklet describes in a popular form some of the 100 efficiency improvements and inventions introduced jointly by the authors during the post-war years at the laboratory of the Moskovskiy zavod imeni Vladimira Il'icha.) (Moscow Plant imeni Vladimir Il'ich). The following automatic instruments are described: devices for checking the plate resistance of rheostats; electric "compasses" which determine stator polarity of an electric motor; devices for the automatic adjustment of low temperatures; control command devices for the plastics department of the plant and for conveyors; and a "relay-combine" now being developed for the automatic maintenance of the required temperature and water level in boilers. The foreword was written by N. Galkin, Party Committee Secretary of the plant. There are no references.
